

Help Save the Bees !

Bees are essential in pollinating both crops and other plants.

Bees provide valuable pollination services for about a third of the food that we eat. But disease, pesticides and a lack of flower diversity have made it difficult for bees to survive. You can help save honey bees, bumblebees and other pollinating insects, by planting wildflowers and other brightly colored flowers. Avoid using any chemicals or pesticides in your gardens.

Let's do our part and help these little pollinators !
